

Electron-coupling-to-waveguide: after meeting yesterday afternoon

Potential for different d :

$V(z)$ decays slower for bigger d/W , then z_{min} solution is bigger

$W = 400 \text{ nm}$
 $h = 300 \mu\text{m}$
 $E_e = 200 \text{ keV}$

$$0 = \frac{V(z_{\text{min}})}{V_0} + \frac{m_e c^2 \gamma_e}{2e} \frac{\beta^2 \sin^2 \theta}{V_0}$$

$d = 2 \mu\text{m}$
