

Electron-coupling-to-waveguide: after meeting yesterday afternoon

Potential for different d :

$V(z)$ decays slower for bigger d/W , then $z_{\min}$ solution is bigger

$W = 400$ nm
 $h = 300 \mu\text{m}$
 $E_e = 200$ keV

$$0 = \frac{V(z_{\min})}{V_0} + \frac{m_e c^2 \gamma_e \beta^2 \sin^2 \theta}{2e V_0}$$

$d = 100 \mu\text{m}$
